

Task: Rebuild the iCoreSprint Design System in Figma

Onboarding task · UI/UX Modernization

Prepared September 20, 2026

CONTEXT

We have a reverse-engineered design system document (`ERPV2/iCoreSprint-design-system.pdf`) for the iCoreSprint brand, built by sampling colors and estimating type/spacing from screenshots of the live marketing site (an automated CSS fetch was blocked at the network level). It documents color tokens, a type scale, a spacing/radius/shadow scale, and a set of primitive components. This document is standing in for a proper Figma source file — your job is to turn it into one.

GOAL

Produce a Figma file that mirrors this design system as reusable styles and components, so it can be used as the actual source of truth going forward instead of a static PDF.

SCOPE

- **1. Color styles** — create a Figma color style for every token in the doc (`brand` , `accent-cyan` , `accent-teal` , `success` , `ink` , `ink-950` , `surface-navy` , `text-secondary` , `text-muted` , `text-on-dark` , `text-on-dark-muted` , `nav-link` , `badge-surface` , `border` , `surface` , `surface-subtle`), named exactly as in the doc. Also recreate the two gradients (hero background, closing CTA band).
- **2. Text styles** — create styles for `hero-h1` , `section-h2` , `card-h3` , `stat-number` , `eyebrow` , `body` , `body-small` , `button-label` , and `footnote` , using the sizes/line-heights/ weights listed. Use Inter (the doc's best guess for the real typeface) rather than the Liberation Sans placeholder used in the PDF.
- **3. Spacing / radius scale** — set up as Figma variables (`space-1` through `space-24` , `radius-sm/md/lg/full`) so components can reference them instead of hardcoded values.
- **4. Shadows** — recreate `shadow-xs` , `shadow-sm` , `shadow-md` , and `shadow-focus` as effect styles.
- **5. Components** — build as Figma components with variants where noted: Button (primary, secondary/outline, inverted), Badge, Eyebrow, Card (default + highlighted/dark variant), ChecklistItem, and Stat.

CAVEATS TO CARRY INTO THE FILE

Colors are exact (pixel-sampled) — treat those as final. Type sizes, line-heights, and spacing are *visual estimates*, not confirmed CSS. Flag these in the Figma file (e.g. a note/annotation) as “estimated — verify against live site” rather than presenting them as ground truth.

DELIVERABLE

- One Figma file, structured as a proper design system (Styles/Variables page + Components page), shared with the team.
- A short list of anything ambiguous or inconsistent in the source PDF that required a judgment call.

OUT OF SCOPE

- No new visual design decisions — this is a faithful rebuild of what's documented, not a redesign.
- No code/token export yet (CSS variables, TS theme) — that is a follow-on step once the Figma file is reviewed.
