GOLDEN LAND · ERP PHASE TWO

What phase two buys, and why each item is worth paying for

Forty-five requests came back from the people who use the system every day — first as a handwritten list in July, then revised line by line by the client in October. This document restates each one in the only terms that matter to the person funding it: what it costs the business today, and what changes the day it ships.

Compiled from the client's six-page handwritten list dated 29 July 2026, as revised by the client on 6 October 2026, with bank reconciliation added at the client's request on 7 October. Items changed in that revision are marked. Page references point back to the original list. Two items the revision removed are not lost: cancelling a payment while keeping it on record is being handled under the auditor's no-deletion rule, and approving staff advances falls inside the wider approval queue. On 8 October a section was added on how certificates and contracts will work, drawn from how Odoo and its community solve the same problem.

45	26	12	15
requests on the list	changed or added in October	to start with	already part-built and cheaper

These are not forty-five problems. They are four.

Read as a list, phase two looks like a long bill of small features. Read by what each item is actually fixing, it collapses into four recurring costs the company is paying right now, every week, without the costs appearing anywhere in the accounts.

1 **Work that is done twice**

The system has no way to amend, so staff delete and re-enter. One late change to a payroll run means re-keying every employee. One date change on a sales request destroys the whole instalment schedule. This is the largest hidden labour cost in the list.

Payroll 2 · Sales 2, 3 · Vouchers 1, 4

2 **Money that moves unwatched**

There is no approval queue, no reconciliation of the books against the bank, no ceiling on what a party or contractor can draw, and no budget-against-actual per project. Overpayment is discoverable only after the project closes, which is after the money has left.

Vouchers 7 · Journal 2 · System 11 · Credit limits 1, 2 · Certificates 1, 3, 4

3

Cash that arrives late

Instalment reminders are manual, post-dated cheques live outside the system, and a customer's true balance is wrong whenever money was taken before contracting. Every one of these delays collection rather than losing it — which is precisely what makes them worth fixing.

Sales 1, 7, 8 · System 5 · Vouchers 2, 3

4

Paper that fights back

Almost every printing complaint says the same thing: the layout has to be fixed by hand before it can be printed. It is the most repeated item in the whole list, and the cheapest hour of the working day to give back.

Reports and the system as a whole

11 requests

p.1 · 1

A reporting engine of its own — pick, order and subtotal the columns, export to Excel and PDF

Every new report today is a development request. An engine lets the finance team build their own, choosing which columns print and in what order, and stops small reporting asks from consuming paid development time. The client will send the list of reports it must cover separately.

Next · Foundations in plac · Revised 6 Oct · L Large

p.1 · 2

Financial statements and comparisons with grouping levels, subtotals, and a drill-down on every number

Lets the owner read a project or department total off the report itself, and click any figure to see what makes it up, instead of exporting to Excel and rebuilding it by hand.

Next · Revised 6 Oct · L Large

p.1 · 3

Four companies on one system — Golden, Ladris, Sawa and the Holding

Runs every entity on a single system rather than buying and staffing more, and makes consolidated group figures possible at all.

Next · Revised 6 Oct · L Large

p.1 · 4	**Scanned documents attached to every record, opened straight from the payment number**	Ends the search through paper files during an audit or a dispute: the supporting document sits one click from the transaction.	Next Foundations in plac M Medium
p.1 · 5	**Post-dated cheque management — maturity, presentation, returns and replacements**	Post-dated cheques are the company's real cash calendar. Holding them in the system — including a cheque swapped for a new one without losing the original transaction — prevents a cheque being presented against an account nobody funded.	Next Revised 6 Oct L Large
p.1 · 6	**Printing that works first time — fixed layout, right page size, company template**	Staff re-format a report or a receipt on every single print. It is the most repeated complaint in the list and the cheapest hour of the day to hand back. The client has since sent a sample of the receipt standard it expects.	Start now Foundations in plac Revised 6 Oct M Medium
p.1 · 7	**A screen for transfers between banks and treasury — CIB to ADIB, treasury to bank**	Internal transfers are entered today as two unrelated payments, which is the standard way a bank balance drifts away from the ledger.	Next M Medium
p.1 · 8	**Payment types redefined**	The current list no longer matches how the company actually pays and collects, which quietly distorts every report grouped by payment type.	Next S Small
p.1 · 9	**Show the debit and credit entry before the voucher is posted, and allow a ledger account — custody or a partner's current account — as the payment method**	Catches a wrong account at the moment of entry rather than at the monthly close, when correcting it costs an accountant the better part of a day. Printing the ledger account on the voucher, and paying straight from custody or a partner account, removes the manual journal that follows today.	Start now Revised 6 Oct M Medium

p.2 · 10	**Reports generated and delivered on a schedule — daily, weekly, monthly, quarterly**	The owner gets the numbers without asking anyone for them, and nobody spends the first hour of the day assembling a report by hand.	Next M Medium
7 Oct	**Bank reconciliation — book balance against the bank statement, account by account**	Confirming one CIB balance this summer took days of manual tracing. A reconciliation screen shows the difference, and the items that explain it, in minutes — and it is the first thing any external auditor asks for. It starts as a manual matching screen; statement upload and automatic matching follow.	Start now Foundations in plac Added in Oct M Medium

Payment vouchers — disbursement and receipt

9 requests

p.3 · 1	**Party and payment type editable when a payment is duplicated, and new payment types wired to the right entries**	Recurring payments are entered by duplication; locking the party forces the clerk back to a blank form every time. New payment types must post to the correct accounts from the first day they are used.	Next Foundations in plac Revised 6 Oct S Small
p.3 · 2	**Sales receipts showing instalment, amount paid and remainder — an overpayment rolls into the next instalment**	Customers rarely pay the exact instalment. Today an over- or under-payment leaves the schedule out of step with the cash, and someone reconciles it by hand. Carrying the difference forward keeps every customer balance true.	Start now Revised 6 Oct M Medium
p.3 · 3	**Partial payment showing amount due, amount actually paid, and the remainder**	Suppliers and contractors are paid in stages. With no remaining balance on screen, the company pays twice or pays short.	Start now Foundations in plac M Medium

p.3 · 4	**Edit or delete a cost centre, and arrange cost centres in a tree with levels**	Cost centres can be created but never corrected, so one typo follows every report ever built on it. A tree lets costs roll up from a building to its project.	Next Foundations in plac Revised 6 Oct M Medium
p.3 · 5	**Voucher lists restructured so every column fits without scrolling sideways**	Clerks scroll left and right to read a single line. Fitting the columns is a small change felt on every screen, every day.	Next M Medium
p.3 · 6	**Receipts printed on the company's own approved template, with their own serial**	The receipt is the one thing the customer or contractor keeps. A printout that looks improvised weakens the company in front of the people paying it. Sales receipts also need a serial that stays in step with the system's automatic numbering.	Next Foundations in plac Revised 6 Oct M Medium
p.3 · 7	**Daily treasury movement, an account statement for any account, a daily activity report per employee — and an approval queue for vouchers and journal entries**	Opening balance, movement, closing balance — plus entry date against approval date, which exposes where a payment sat waiting. Approvals are chased by phone today; one queue for receipts, payments and journal entries makes the delay visible and stops anything sitting unapproved for days.	Start now Foundations in plac Revised 6 Oct L Large
p.3 · 8	**A rentals screen — rent due, due dates and parties, with the accrual posted automatically**	Rent obligations are tracked outside the system today, so they reach the books only when paid. Accruing them on their due date, against each party's account, shows what the company owes before the payment falls due.	Next Added in Oct L Large
p.3 · 9	**Real filters — date range, several filters at once, sorting by due status, subtotals that follow the filter**	Finding last quarter's payments to one contractor is a manual scan today; proper filters turn it into a few seconds, and a subtotal answers "how much" without an export.	Next Foundations in plac Revised 6 Oct S Small

Journal entries

3 requests

p.4 · 1	**A daily report of every journal entry, attributed to the employee who posted it**	Makes each accountant answerable for their own postings, and shortens the hunt when an entry has to be traced back.	Next Foundations in plac S Small
p.4 · 2	**The same permission rules on journal entries as on vouchers**	A journal entry moves money on the books exactly as a voucher does. Leaving it under looser control is the widest open door in the system.	Start now Foundations in plac S Small
p.4 · 3	**Show the originating payment or invoice number on automatically generated entries**	Turns an unexplained entry into a traceable one — which is most of the work in answering an auditor.	Next S Small

Payroll and staff advances

6 requests

p.4 · 1	**Sort, filter and search payroll by name, department or amount**	A payroll run covers the whole company; without search, checking one employee means reading the entire list.	Next S Small
p.4 · 2	**Edit one employee's payroll invoice without deleting the whole run**	A single late change forces deleting and re-entering every employee — hours of work and a fresh chance of error, every month.	Start now L Large
p.4 · 3	**Leave used shown alongside leave balance and accrued entitlement**	Answers the question every employee brings to HR, without an accountant opening three screens to work it out.	Next Revised 6 Oct M Medium
p.4 · 4	**Change the monthly deduction on an advance, or let the employee pay an instalment in cash**	Repayment terms get renegotiated. The system should record the new instalment instead of forcing the advance to be cancelled and rebuilt — and a cash option stops a missed deduction becoming a debt nobody tracks.	Next Revised 6 Oct M Medium

p.4 · 5	**Reassign or increase an existing advance**	Handles the ordinary case of a second advance on top of the first, without leaving a duplicate record to reconcile later.	Later S Small
p.4 · 6	**An advance statement — the payment that funded it, every deduction since, and what remains**	Settles an argument about what an employee has repaid with a printed statement instead of a conversation. Showing advance, paid and remaining on the main screen answers it before anyone asks.	Later Revised 6 Oct M Medium

Credit limits

2 requests

p.5 · 1	**Credit limit per party — raise it in the system, and see each payment drawn against it with the running balance**	Limits are raised today by asking the developer, and nobody can see how much of a limit is left. Limit, used and remaining on the main screen turn a phone call into a glance.	Next Foundations in plac Added in Oct M Medium
p.5 · 2	**Credit limit per project — usage across every certificate and contractor, and what remains**	Puts a ceiling on what a project can commit across all its contractors and suppliers, so the total is watched, not just each contract. It depends on the certificates work and is sequenced with it.	Later Added in Oct L Large

Sales

8 requests

p.5 · 1	**WhatsApp messaging to customers — reminders before a due date, overdue notices, cheque instructions**	Collection improves most from a reminder sent before the money is late. This is the clearest direct return on cash flow anywhere in the list. The same alerts reach the treasury clerk and their manager the day before a cheque is due, so it gets to the bank on time.	Start now Revised 6 Oct M Medium

p.5 · 2	**Edit the non-financial details of a sales request — a date, the salesperson — without deleting every instalment behind it**	Changing one date destroys the payment schedule and its history. Rebuilding it by hand is exactly where collection records get lost.	Start now Revised 6 Oct M Medium
p.5 · 3	**Keep the sales request through a resale, a change of customer, or an increase in area and price**	A unit resold, or a roof added once a permit comes through, is ordinary business here. The contract history should survive it rather than be re-created.	Next L Large
p.5 · 4	**Restructure instalments freely, mixing monthly, quarterly and annual, in a plan built and printed before posting**	The payment plan is what closes the sale. A system that offers only one rhythm limits what the sales team is able to agree to. Building the plan on screen and printing it for the customer replaces the Excel sheet used today.	Start now Revised 6 Oct L Large
p.5 · 5	**Targets against actuals — sales, collections, construction and spend — by month or quarter, with project taxes and expenses in the project report**	A dashboard can show what happened; only targets stored in the system can show whether it was good enough. Management enters each target once, and every report then measures against it.	Next Added in Oct M Medium
p.5 · 6	**Commission calculated on what is actually collected, keyed to the unit, payable to more than one party — with its tax**	The core was delivered after the list was written: commission now follows collection instead of contract value, which stops a broker being paid for money the company has not received. Still open: the tax withheld from commissions and owed to the tax authority, linked to e-invoicing, with commission payments posting the agreed entries.	Next Foundations in plac Revised 6 Oct M Medium

p.5 · 7	**A payment plan that totals sale price plus maintenance deposit, with cheque details and one receipt for all of a unit's cheques**	The maintenance deposit is collected alongside the price but sits outside the plan, so the contracted total on screen is wrong. One receipt for all of a unit's cheques matches how the customer actually hands them over.	Start now Revised 6 Oct L Large
p.5 · 8	**Fold reservation deposits taken before contracting into the down payment**	Reservation money collected before the sales request sits in the project's reservation account, outside the plan, so the customer's balance is wrong from day one.	Next Revised 6 Oct M Medium

Contractor certificates

6 requests

Sequenced last in phase two, at the client's request (6 Oct). Built on a contracts module — see "How the certificates will work" below.

p.6 · 1	**Record every contractor and supplier contract against its project — value, paid, remaining**	Without the contract in the system, nobody can say whether a contractor has been overpaid until the project is finished and the money is gone.	Later L Large
p.6 · 2	**Cumulative progress percentages on certificates — this certificate against the total to date**	The client wrote the arithmetic out himself: 10,000 at 20% this certificate, 30% cumulative. That calculation decides what a contractor is owed this month.	Later M Medium
p.6 · 3	**Budget against actual for every project, with expenses matched to committed amounts**	The one report that tells the owner whether a project is making money while it can still be corrected, rather than after handover.	Later Foundations in plac L Large
p.6 · 4	**Link every certificate to that contractor's contract value on the project**	Makes over-certification visible at the moment of entry instead of at final account.	Later M Medium
p.6 · 5	**Widen the item description so the full text is visible**	A truncated description gets the wrong item approved. The fix is trivial; the error is not.	Later S Small

p.6 · 6

Convert quantities when the unit of measure changes

Changing a unit without converting its quantity silently changes the value of the certificate.

Later

S Small

How the certificates will work — and what we are borrowing

Certificates come last in phase two, but their design decides how the contracts module, the project credit limit and budget against actual are built, so it is settled now. Before writing it we looked at how Odoo — the most widely used open ERP — and the people who build on it handle the same problem: Odoo's own "Property Developer" package, the purchase modules of the Odoo Community Association, and the specialised certificate (IPC) modules sold on the Odoo Apps Store. They agree on one model, and it is the model below. We borrow the behaviour, not their code.

1 **The contract comes first**

Each contractor or supplier contract is entered once against its project and building: value, bill of quantities (item, unit, quantity, rate), retention %, advance and dates. Every certificate is raised against a contract, never on its own, so contracted, certified, paid and remaining are always on screen.

Certificates 1, 4

2 **Progress is cumulative; the certificate is the difference**

Each line keeps the quantity or percentage achieved to date. The engineer enters this period's progress — as a percentage or a quantity — and the screen shows previous, this certificate and to date. A whole section can be advanced by one percentage.

Certificates 2

3 **No edits after approval**

The amount due is always "to date minus what was already certified", so a mistake in one certificate corrects itself in the next, instead of someone editing an approved one.

4 **Over-certification stopped at entry**

Going above 100% of a line, or above the contract value, is blocked on a fixed-price contract unless an approved variation raises it; on a re-measured contract it warns.

Certificates 4

5 **Retention, advance and penalties belong to the contract**

Retention is held in its own account per contract and released by a release certificate at handover and after the defects period. An advance paid to a contractor is recovered automatically from each certificate. A delay penalty is worked out from the due date. Today retention is added as extra lines on each order.

6 **One approved certificate, one supplier invoice**

Approval creates the invoice for the net amount — today a new purchase order is created for every certificate. Payments link to it, so each certificate shows paid, remaining and status.

Vouchers 3

7 A visible approval path

Draft → submitted by the site engineer → verified by the quantity surveyor → approved by the project or finance manager → invoiced → paid. A rejection carries its reason; an approved certificate is locked and printed for signature. It joins the same approval queue as vouchers.

Vouchers 7

8 Variations are documents, not edits

Extra or changed work is a variation with its own approval. Contract value = original + approved variations, so the record of what was agreed survives.

9 Committed money becomes visible

Contract value not yet certified is committed; certified is actual. Contracted, certified, paid and remaining per project are available from the first contract, before any budget exists — and are what the project credit limit measures. With a budget: under 90% passes, 90–100% warns and needs the project or finance manager, over 100% is blocked until the budget is raised.

Certificates 3 · Credit limits 2

10 Numbering per contract

“Contract C-012, certificate 4” replaces the running number per contractor, which is how some certificate numbers were issued twice this year.

The client’s own arithmetic, worked through: a 10,000 contract, 5% retention, and an advance recovered at 10% of each certificate

	Certificate 1	Certificate 2
Progress this certificate	10%	20%
Progress to date	10%	30%
Gross to date	1,000	3,000
Retention to date (5%)	50	150
Advance recovered to date (10%)	100	300
Net to date	850	2,550
Already certified	0	850
Due on this certificate	**850**	**1,700**

Certificate 2 is worth 20% of the contract (2,000), less 5% retention and 10% advance recovery: 1,700. The figure comes out of the cumulative columns — nobody types it.

> **On the sales side** (proposed, not on the client’s list): an instalment can fall due when a construction milestone is reached — the roof completed, say — not only on a date; each unit

> shows its status (available, reserved, sold) with one click to its sales request, payments and commissions; and a list of site remarks per unit supports handover to buyers.

Where I would start

These twelve carry the weight of all four costs above, and none of them depends on the rest of the list being funded. Taken together they stop the rework, put a visible approval and a bank reconciliation in front of the company's cash, and keep every customer's balance true from the first payment. The contractor-certificate work — contracts, progress, budget against actual — follows at the end of phase two, as the client asked.

p.1	Printing that works first time — fixed layout, right page size, company template
7 Oct	Bank reconciliation — book balance against the bank statement, account by account
p.3	Partial payment showing amount due, amount actually paid, and the remainder
p.4	The same permission rules on journal entries as on vouchers
p.5	WhatsApp messaging to customers — reminders before a due date, overdue notices, cheque instructions
p.5	Restructure instalments freely, mixing monthly, quarterly and annual, in a plan built and printed before posting
p.1	Show the debit and credit entry before the voucher is posted, and allow a ledger account — custody or a partner’s current account — as the payment method
p.3	Sales receipts showing instalment, amount paid and remainder — an overpayment rolls into the next instalment
p.3	Daily treasury movement, an account statement for any account, a daily activity report per employee — and an approval queue for vouchers and journal entries
p.4	Edit one employee’s payroll invoice without deleting the whole run
p.5	Edit the non-financial details of a sales request — a date, the salesperson — without deleting every instalment behind it
p.5	A payment plan that totals sale price plus maintenance deposit, with cheque details and one receipt for all of a unit’s cheques

On the source. The original is handwritten, and three marginal notes were ambiguous. The client's October revision settled two of them — the post-dated cheque annotation on page 1, and the boundary on page 4, which turned out to be credit limits rather than advances. Only the final line on page 6, on changing units of measure, still needs confirming before it is priced.

Build sizes are relative effort, not price: S is days, M is a week or two, L is a month or more of development. Items marked as having foundations already in the system are cheaper than their size suggests.
