

What phase two buys, and why each item is worth paying for

Forty-two requests came back from the people who use the system every day. This document restates each one in the only terms that matter to the person funding it: what it costs the business today, and what changes the day it ships.

Compiled from the client's six-page handwritten list dated 29 July 2026. Page references below point back to that original so any item can be checked against the handwriting.

42 requests on the list	6 areas of the business	14 to start with	15 already part-built and cheaper
---	---	--	---

These are not forty-two problems. They are four.

Read as a list, phase two looks like a long bill of small features. Read by what each item is actually fixing, it collapses into four recurring costs the company is paying right now, every week, without the costs appearing anywhere in the accounts.

- 1

Work that is done twice

The system has no way to amend, so staff delete and re-enter. One late change to a payroll run means re-keying every employee. One date change on a sales request destroys the whole instalment schedule. This is the largest hidden labour cost in the list.

Payroll 2 · Sales 2, 3 · Vouchers 1, 4
- 2

Money that moves unwatched

There is no approval queue, no ceiling on what a contractor can be certified for, and no budget-against-actual per project. Overpayment is discoverable only after the project closes, which is after the money has left.

Vouchers 7, 8 · Journal 2 · Certificates 1, 3, 4

3

Cash that arrives late

Instalment reminders are manual, post-dated cheques live outside the system, and a customer's true balance is wrong whenever money was taken before contracting. Every one of these delays collection rather than losing it — which is precisely what makes them worth fixing.

Sales 1, 7 · System 5 · Vouchers 3

4

Paper that fights back

Almost every printing complaint says the same thing: the layout has to be fixed by hand before it can be printed. It is the most repeated item in the whole list, and the cheapest hour of the working day to give back.

Foundations already in the system

Delivered since the list was written

S / M / L build size

Reports and the system as a whole

10 requests

p.1 · 1

A reporting engine of its own, plus detailed custom reports on request

Every new report today is a development request. An engine lets the finance team build their own and stops small reporting asks from consuming paid development time.

Next

Foundations in place

L Large

p.1 · 2

Grouping levels and subtotals in departmental reports

Lets the owner read a project or department total off the report itself, instead of exporting to Excel and summing it by hand.

Next

M Medium

p.1 · 3

More than one company on one system — Golden and Al-Ard Holding

Runs both entities on a single system rather than buying and staffing a second one, and makes consolidated group figures possible at all.

Next

L Large

p.1 · 4

Scanned documents attached to every record, opened straight from the payment number

Ends the search through paper files during an audit or a dispute: the supporting document sits one click from the transaction.

Foundations in place

M Medium

p.1 · 5	Post-dated cheque management — maturity, presentation, returns	Post-dated cheques are the company's real cash calendar. Holding them in the system prevents a cheque being presented against an account nobody funded.	Next L Large
p.1 · 6	Printing that works first time — fixed layout, right page size, company template	Staff re-format a report or a receipt on every single print. It is the most repeated complaint in the list and the cheapest hour of the day to hand back.	Start now Foundations in place M Medium
p.1 · 7	A screen for transfers between banks and treasury — CIB to ADIB, treasury to bank	Internal transfers are entered today as two unrelated payments, which is the standard way a bank balance drifts away from the ledger.	Next M Medium
p.1 · 8	Payment types redefined	The current list no longer matches how the company actually pays and collects, which quietly distorts every report grouped by payment type.	Next S Small
p.1 · 9	Show the debit and credit entry on screen before the voucher is posted	Catches a wrong account at the moment of entry rather than at the monthly close, when correcting it costs an accountant the better part of a day.	Start now S Small
p.2 · 10	Reports generated and delivered on a schedule — daily, weekly, monthly, quarterly	The owner gets the numbers without asking anyone for them, and nobody spends the first hour of the day assembling a report by hand.	Next M Medium

Payment vouchers — disbursement and receipt

9 requests

p.3 · 1	Party and payment type editable when a payment is duplicated	Recurring payments are entered by duplication; locking the party forces the clerk back to a blank form every time.	Next Foundations in place S Small
---------	---	--	---

p.3 · 2	Cancel a payment from the actions menu, and keep it on screen in red	Cancelled payments vanish today, so nobody can explain what became of a voucher. Keeping the record visible preserves the audit trail without touching balances.	Start now Foundations in place S Small
p.3 · 3	Partial payment showing amount due, amount actually paid, and the remainder	Suppliers and contractors are paid in stages. With no remaining balance on screen, the company pays twice or pays short.	Start now Foundations in place M Medium
p.3 · 4	A screen to edit or delete a cost centre	Cost centres can be created but never corrected, so one typo follows every report ever built on it.	Next Foundations in place S Small
p.3 · 5	Voucher lists restructured so every column fits without scrolling sideways	Clerks scroll left and right to read a single line. Fitting the columns is a small change felt on every screen, every day.	Next M Medium
p.3 · 6	Receipts printed on the company's own approved template	The receipt is the one thing the customer or contractor keeps. A printout that looks improvised weakens the company in front of the people paying it.	Next Foundations in place M Medium
p.3 · 7	Daily treasury movement, and a daily activity report per employee	Opening balance, movement, closing balance — plus entry date against approval date, which is what exposes where a payment sat waiting.	Start now Foundations in place M Medium
p.3 · 8	An approval queue for transactions awaiting sign-off	Approvals are chased by phone today. A queue makes the delay visible and stops a payment sitting unapproved for days.	Start now M Medium
p.3 · 9	Real filters — date range, several filters at once, sorting by due status	Finding last quarter's payments to one contractor is a manual scan today; proper filters turn it into a few seconds.	Next Foundations in place S Small

Journal entries

3 requests

p.4 · 1	A daily report of every journal entry, attributed to the employee who posted it	Makes each accountant answerable for their own postings, and shortens the hunt when an entry has to be traced back.	Next Foundations in place S Small
p.4 · 2	The same permission rules on journal entries as on vouchers	A journal entry moves money on the books exactly as a voucher does. Leaving it under looser control is the widest open door in the system.	Start now Foundations in place S Small
p.4 · 3	Show the originating payment or invoice number on automatically generated entries	Turns an unexplained entry into a traceable one — which is most of the work in answering an auditor.	Next S Small

Payroll and staff advances

7 requests

p.4 · 1	Sort, filter and search payroll by name, department or amount	A payroll run covers the whole company; without search, checking one employee means reading the entire list.	Next S Small
p.4 · 2	Edit one employee's payroll invoice without deleting the whole run	A single late change forces deleting and re-entering every employee — hours of work and a fresh chance of error, every month.	Start now L Large
p.4 · 3	Advance balance shown alongside leave balance and accrued entitlement	Answers the question every employee brings to HR, without an accountant opening three screens to work it out.	Next M Medium
p.4 · 4	Change the monthly deduction on an advance after a new agreement	Repayment terms get renegotiated. The system should record the new instalment instead of forcing the advance to be cancelled and rebuilt.	Next M Medium

p.4 · 5	Reassign or increase an existing advance	Handles the ordinary case of a second advance on top of the first, without leaving a duplicate record to reconcile later.	Later S Small
p.4 · 6	Click an advance amount to see and print its full statement	Settles an argument about what an employee has repaid with a printed statement instead of a conversation.	Later S Small
p.4 · 7	Advance requests listed with their voucher numbers and amounts, behind an approval queue	An advance is cash leaving the company; it should pass the same visible approval as any other payment.	Next S Small

Sales

7 requests

p.5 · 1	WhatsApp messaging to customers — reminders before a due date, overdue notices, cheque instructions	Collection improves most from a reminder sent before the money is late. This is the clearest direct return on cash flow anywhere in the list.	Start now M Medium
p.5 · 2	Edit a sales request without deleting every instalment behind it	Changing one date destroys the payment schedule and its history. Rebuilding it by hand is exactly where collection records get lost.	Start now M Medium
p.5 · 3	Keep the sales request through a resale, a change of customer, or an increase in area and price	A unit resold, or a roof added once a permit comes through, is ordinary business here. The contract history should survive it rather than be re-created.	Next L Large
p.5 · 4	Restructure instalments freely, mixing monthly, quarterly and annual in one plan	The payment plan is what closes the sale. A system that offers only one rhythm limits what the sales team is able to agree to.	Start now L Large

p.5 · 5	Commission calculated on what is actually collected, keyed to the unit, payable to more than one party	Delivered since this list was written. Commission now follows collection instead of contract value, which stops a broker being paid for money the company has not received.	Later Delivered M Medium
p.5 · 6	One comprehensive sales report — requests, revenue, and tax payable, linked to e-invoicing	Brings the amount owed to the tax authority out of a spreadsheet and into the system that already holds the underlying invoices.	Next Foundations in place L Large
p.5 · 7	Fold payments taken before contracting into the approved schedule	Reservation money collected before the sales request sits outside the plan, so the customer's balance is wrong from day one.	Next M Medium

Contractor certificates

6 requests

p.6 · 1	Record every contractor and supplier contract against its project — value, paid, remaining	Without the contract in the system, nobody can say whether a contractor has been overpaid until the project is finished and the money is gone.	Start now L Large
p.6 · 2	Cumulative progress percentages on certificates — this certificate against the total to date	The client wrote the arithmetic out himself: 10,000 at 20% this certificate, 30% cumulative. That calculation decides what a contractor is owed this month.	Start now M Medium
p.6 · 3	Budget against actual for every project, with expenses matched to committed amounts	The one report that tells the owner whether a project is making money while it can still be corrected, rather than after handover.	Start now Foundations in place L Large
p.6 · 4	Link every certificate to that contractor's contract value on the project	Makes over-certification visible at the moment of entry instead of at final account.	Next M Medium

p.6 · 5	Widen the item description so the full text is visible	A truncated description gets the wrong item approved. The fix is trivial; the error is not.	Later S Small
p.6 · 6	Convert quantities when the unit of measure changes	Changing a unit without converting its quantity silently changes the value of the certificate.	Later S Small

Where I would start

These fourteen carry the weight of all four costs above, and none of them depends on the rest of the list being funded. Taken together they stop the rework, put a visible approval in front of money leaving the company, and make a project's profit readable while it can still be changed.

p.1 Printing that works first time — fixed layout, right page size, company template

p.3 Cancel a payment from the actions menu, and keep it on screen in red

p.3 Daily treasury movement, and a daily activity report per employee

p.4 The same permission rules on journal entries as on vouchers

p.5 WhatsApp messaging to customers — reminders before a due date, overdue notices, cheque instructions

p.5 Restructure instalments freely, mixing monthly, quarterly and annual in one plan

p.6 Cumulative progress percentages on certificates — this certificate against the total to date

p.1 Show the debit and credit entry on screen before the voucher is posted

p.3 Partial payment showing amount due, amount actually paid, and the remainder

p.3 An approval queue for transactions awaiting sign-off

p.4 Edit one employee's payroll invoice without deleting the whole run

p.5 Edit a sales request without deleting every instalment behind it

p.6 Record every contractor and supplier contract against its project — value, paid, remaining

p.6 Budget against actual for every project, with expenses matched to committed amounts

On the source. The original is handwritten and a few marginal notes are genuinely ambiguous — the annotation beside post-dated cheques on page 1, the boundary between the payroll and advances items on page 4, and the final line on page 6. Those three are transcribed as read and should be confirmed with the user before any of them is priced.

Build sizes are relative effort, not price: S is days, M is a week or two, L is a month or more of development. Items marked as having foundations already in the system are cheaper than their size suggests.
